CHIPSEALER

SYNCHRONEOUS SPRAYER SPREADER

Road maintenance is an important expense for project owners and managers who are looking to optimize their short, medium and long-term maintenance spending within the available budget.

In this context, preventive maintenance techniques are of great interest to the project owners as they allow maintaining a satisfactory level of service while preserving the pavement structure, Thus avoiding the more expensive maintenance work.

In addition to the budgetary constraints, environmental constraints have been added; the techniques of preventive maintenance with asphalt emulsion, a bitumen and water mixture, therefore present a high environmental interest as long as their implementation is carried out cold, This will reduce the greenhouse gas emissions associated with the road jobsite.

In this context, the CHIPSEALER or our Synchronous Gravel Spreading Machine is the ideal machine to combine profitability and decarbonisation during your road maintenance work.

Versatile and multi-application material, tack coat, impregnation coatings, wearing surface coatings, curative treatments (potholes...).

This means that the number of machines on site is limited and the time of use optimized, thus reducing the carbon footprint of the site.

User-designed equipment: Capacities, working widths, operation and options are optimized for each client according to the type of work to be carried out.

CHIPSEALER are equipped with a computer and a cockpit to regulate the dosages according to several parameters, speed of movement, working width, grain size, road profile.

The essential functions are made more accessible with the SMART CAB combination of touch screen, joystick and buttons, thus promoting the handling of equipment, interest for work and an optimization of the use of the machine.

The certainty of applying the right quantity in the right place to ensure profitable and decarbonized projects.

About SECMAIR

Secmair, a Fayat Group Company for almost two decades, is the Euopean leader for developing and manufacturing road maintenance machinery since 1981. Featuring the most complete line of road maintenance equipment, from surface dressing to cold mix asphalt, as well as crack bridging and pothole treatment, SECMAIR is positioned to offer a solution for every road maintenance requirement. SECMAIR one single production site constitutes a unique platform to guarantee state-of-the art product industrialization alongside transversal components, ensuring outstanding reliability and first-class after-sales services.
